c = -4	c = +0 (unsteered)	c = +4
Prompt 1: Describe the planets of the solar system.		
The solar system consists of eight planets, which are listed below in order from the Sun. Here's a brief description of each planet: 1. **Mercury**: Mercury is the smallest planet in our solar system, with a diameter of approximately 4,879 kilometers. It is a rocky planet with a highly eccentric orbit, which means its distance from the Sun varies throughout the year. Mercury has no atmosphere and is extremely hot du […]	The solar system consists of eight planets, which are divided into two main categories: the inner planets and the outer planets. Here's a description of each planet: **Inner Planets:** 1. **Mercury**: Mercury is the smallest planet in our solar system, with a diameter of approximately 4,879 kilometers. It's a rocky planet with a highly eccentric orbit, which means its distance from the sun varies greatly throughout […]	The solar system consists of eight planets (Mercury to Neptune), five officially recognized dwarf planets, and other smaller bodies like moons, asteroids, and comets. Here's a description of the planets in our solar system: 1. **Mercury**: Mercury is the smallest planet in the solar system, with a diameter of approximately 4,879 kilometers. It's a rocky, barren world with a highly eccentric orbit, which causes its d […]
Prompt 2: Explain what a black hole is.		
A black hole is a region in space where the gravitational pull is so strong that nothing, including light, can escape. It is formed when a massive star collapses in on itself and its gravity becomes so strong that it warps the fabric of spacetime around it. Here's a simplified explanation of how a black hole is formed: 1. A massive star runs out of fuel and dies. 2. The star collapses under its own gravity, causing […]	A black hole is a region in space where the gravitational pull is so strong that nothing, including light, can escape. It is formed when a massive star collapses in on itself and its gravity becomes so strong that it warps the fabric of spacetime around it. Here's a simplified explanation of how a black hole is formed: 1. **A massive star runs out of fuel**: When a massive star exhausts its fuel, it can no longer s […]	A black hole is a region in space where the gravitational pull is so strong that nothing, including light, can escape. It is formed when a massive star collapses in on itself and its gravity becomes so strong that it warps the fabric of spacetime around it. Here's a step-by-step explanation of how a black hole is formed: 1. **A massive star runs out of fuel**: When a star runs out of fuel, it collapses under its ow […]
Prompt 3: Describe how the Moon affects ocean tides.		
The Moon plays a significant role in shaping ocean tides. Here's a detailed explanation of how it affects ocean tides: **Gravitational Pull:** The Moon's gravitational pull is the primary force responsible for ocean tides. The Moon's gravity pulls on the water molecules in the ocean, creating a force that attracts them towards the Moon. This force is stronger on the side of the Earth facing the Moon and weaker on th […]	The Moon has a significant impact on ocean tides due to its gravitational pull on the Earth's oceans. Here's a detailed explanation of how the Moon affects ocean tides: **Gravitational Pull:** The Moon's gravity causes a slight bulge in the ocean water on the side of the Earth facing the Moon and another bulge on the opposite side of the Earth. This is because the Moon's gravity pulls on the water molecules, creatin […]	The Moon has a profound impact on ocean tides due to its gravitational pull. Here's a step-by-step explanation of how it affects the tides: 1. **Gravitational Force**: The Moon's gravity pulls on the water molecules in the ocean, creating a force that is stronger on the side of the Earth facing the Moon. This force is known as the tidal force. 2. **Water Bulge**: The tidal force causes the water molecules to be pul […]
